Yamaha DC7 - PE

Yamaha DC7-PE

Classic Yamaha grand pianos fitted with innovative Yamaha electronics, Disklavier Mark III Series full-function Grand delivers superb musical performance, along with an unprecedented range of Digital/acoustic capabilities.

The Yamaha DC7A is by far the most flexible of the range we have to offer, with a quality of sound and the added benefits of the Disklavier control unit it really has it all....

How it works

In playback mode, ultra responsive solenoids reproduce the actions of the recording pianist exactly as if the artist were sitting there at the keyboard. Recording is made possible by pairs of specially designed optical key or key and hammer sensors that work together to register every aspect of the player's touch-timing, velocity, duration and release-without any effect on the feel or motion of the keys. Unlike sensors relying on physical contact, this unique optical system allows the Disklavier to retain the natural touch and response of an acoustic piano, while delivering the ultimate in accuracy and musical performance. Data from these sensors can also be used to play some of the many Disklavier XG digital instrumental voices in unison with the acoustic piano, or transmitted to a variety of computer and MIDI devices. Sensors and solenoids at the piano's pedals precisely register and reproduce their motion as well.

MIDI and AUX connections

Along with computer connectivity, Disklavier pianos also provide plug-and-play access to a world of other external equipment.

MIDI In/Out jacks let you control devices like synthesizers and sequencers from the Disklavier piano keyboard, add the capabilities of other MIDI devices to your Disklavier ensemble, or play the Disklavier's piano and instrumental tones from external equipment.

AUX connections let you amplify the Disklavier's sound via external audio equipment, or record your own performances directly to conventional audio media, without microphones or the time-consuming trial-and-error setup of typical acoustic piano recording.

The AUX In jack also allows you to listen and play along with audio recordings through the Disklavier's own speakers or headphones.
